

Company Project Explanation

Project: DocAssist AI | **Company:** NovaEdge Solutions

DocAssist AI is an internal knowledge-assistant platform designed to help employees quickly retrieve answers from company documents, image-based content, and frequently asked questions. The project combines document ingestion, OCR, retrieval, and generative answering into a single web-based system.

Business Problem

Teams spend too much time searching across scattered PDFs, screenshots, manuals, and process documents. This leads to delayed decisions and repeated support requests.

Proposed Solution

Create a centralized assistant that ingests enterprise content, builds searchable knowledge indexes, and returns concise, context-aware answers through a chat interface.

Key Features

- Multi-format ingestion (PDFs, images, notes)
- OCR for scanned documents
- Hybrid retrieval for better relevance
- Query analytics and usage dashboards
- Role-based access for internal teams

Solution Architecture Overview

Goal: Build an internal AI assistant that answers employee queries from enterprise knowledge source
Key benefit: Faster information retrieval, lower support load, and improved document discoverability.

Implementation Highlights

Module	Purpose
Document Parser	Extracts structured text from PDFs and images
Search Layer	Combines dense retrieval with keyword matching
Answer Engine	Generates natural-language responses using retrieved context
Admin Dashboard	Tracks uploads, query volume, quality, and adoption

Results, Metrics, and Visual Summary

The pilot rollout showed encouraging results across usage, answer quality, and operational efficiency. The charts below summarize how the project matured over a 6-month implementation period and what outcomes were observed after deployment.

Key Takeaways

- Employee adoption reached **78%** within the pilot teams.
- Retrieval + answer quality improved to approximately **91%** on internal evaluations.
- Average response time stayed around **2.4 seconds** for common queries.
- Support effort related to repeated documentation questions dropped by **26%**.
- Most retrieved knowledge came from structured document repositories, followed by web pages and image-based references.
